Abstract

Water contamination remains an issue. A combination of biodegradation and nanotechnology is proposed as a potential proficient, minimal effort, and naturally amiable system to deal with it. Among different mediators, bioremediation procedures can conceivably be utilized to decrease the versatility of materials in the subsurface, reducing the potential for human and ecological exposure. The metabolic diversity of microorganisms ensures an assortment of substrates to be expended. Photosynthetic microorganisms have been found as a compelling and eco-friendly species that can remove carbon, nitrogen, and phosphorus in the manufactured sewage and wastewater. This chapter particularly emphasizes environmentally friendly NMs that give information for removing contaminants from wastewater and effluents. Additionally, various nanocomposites and different natural methods utilized in the wastewater treatment process are also briefly discussed.

Introduction

Water on the planet is the most significant natural resource. Presently ecological water sully has been ascendant in most recent couple of decades as a result of expanded human exercises, risky farming practices and industrialization (Azubike et al. 2016). Thus, the principle challenge is consistent defilement of water resources by different inorganic and natural pollutants. So, conventional treatment strategies are not proficient to whole expulsion of toxins and accessible methods for waste water have numerous disadvantages (Ferroudi et al. 2013). Presently, contamination in view of overwhelming metals in ground water, waste water and lakes caused problematic wellbeing impacts in living creatures. This section centers the distinctive nanoparticles for contaminant water treatment forms. The procedure of contamination evacuation relies principally upon the idea of the toxin, which may include: agrochemicals, chlorinated mixes, colors, ozone depleting substances, overwhelming metals, hydrocarbons, atomic waste, plastics and sewage (Akhavan and Azimirad 2009). Pollutant nature, profundity and level of contamination, kind of condition, area, cost, and ecological approaches are a portion of the determination criteria that are viewed as while picking any bioremediation strategy (Beaver et al. 2014). Besides, given the idea of exercises prompting raw petroleum contamination, all things considered, contamination of nature with toxins barring hydrocarbons can without much of a stretch be forestalled and controlled. The natural wastewater treatment is generally applied however these are normally moderate, restricted because of the nearness of non-biodegradable contaminant, and at some point makes toxicity to microorganisms because of some poisonous contaminants (Chen et al. 2016). The physical procedures, for example, ultrafiltration could evacuate the pollutant and impurity matters by changing primary stage to next however delivering more concentrate sludge, which is harmful and difficult to dispose. The genuine necessity for most incredible advancements for management of city and mechanical waste and polluted waters (Chong et al. 2010). Nanotechnology in various literature described as one of the best exceptional procedures for contaminate water treatment. Nano-materials have nano structures that people have created, having shape and size of nanometers. Nano-materials created in assortment of structures, for example, nanotubes, nanowires, particles, films, colloids and quantum dots (Douglas et al. 2016). Nano-adsorbent has been delivered using the particles of components which are unnaturally vibrant and have highest adsorption capacity on the outside of nano-material. The used materials for improvement of nano-adsorbents include activated silica, carbon, metal oxides, clay materials and modified compounds as nono-composites. Various sorts of nano-catalysts and electrocatalysts are utilized for degradation of contamination in wastewater. Fenton mediated catalysts for improving oxidation of natural toxins and various catalysts having antimicrobial activities (Eldyasti et al. 2011; Feng et al. 2014). In nanomembrane classification, the pres-sure determined treatment of contaminated wastewater can demonstrate for improving water quality of desire. Among various sorts of film filtration (FF), and nano-filtration (NF) are mainly applied for management of contaminated water in ventures as an effect of minimal effort, little pore sizes, more efficiency and ease to handle.

Table of Contents	<input type="button" value="View Full PDF"/>
Detailed Table of Contents	<input type="button" value="View Full PDF"/>
Foreword	<input type="button" value="View Full PDF"/>
Maulin P. Shah (Industrial Waste Water Research Lab, Division of Applied and Environmental Microbiology, Enviro Technology Limited, India)	
Preface	<input type="button" value="View Full PDF"/>
Satarupa Dey (Shyampur Siddheswari Mahavidyalaya, India)	
Acknowledgment	<input type="button" value="View Full PDF"/>
Satarupa Dey (Shyampur Siddheswari Mahavidyalaya, India), Biswaranjan Acharya (School of Computer Engineering, KIIT University (Deemed), India)	
Chapter 1	\$29.50
Different Bioremediation Techniques for Management of Waste Water: An Overview (pages 1-18)	<input type="button" value="Add to Cart"/>
Biswajit Patra (Sambalpur University, Odisha, India), Saroj Kumar Deep (Sambalpur University, Odisha, India), Surya Narayan Pradhan (School of Life Sciences, Sambalpur University, Odisha, India)	<input type="button" value="Preview Chapter"/>
Chapter 2	\$29.50
Tolerance of Microorganisms to Heavy Metals (pages 19-35)	<input type="button" value="Add to Cart"/>
Joan Mwhaki Nyika (Technical University of Kenya, Kenya)	<input type="button" value="Preview Chapter"/>
Chapter 3	\$29.50
Microbial Enzymes and Their Mechanisms in the Bioremediation of Pollutants (pages 36-53)	<input type="button" value="Add to Cart"/>
Karthika Rajamanickam (Mahendra Arts and Science College (Autonomous), India), Jayanthi Balakrishnan (Mahendra Arts and Science College (Autonomous), India), Selvankumar Thangaswamy (Mahendra Arts and Science College (Autonomous), India), Govarthanan Muthusamy (Kyungpook National University, South Korea)	<input type="button" value="Preview Chapter"/>
Chapter 4	\$29.50
The Use of Microorganism-Derived Enzymes for Bioremediation of Soil Pollutants (pages 54-71)	<input type="button" value="Add to Cart"/>
Joan Mwhaki Nyika (Technical University of Kenya, Kenya)	<input type="button" value="Preview Chapter"/>
Chapter 5	\$29.50
Role of Bacterial Chromate Reductase in Bioremediation of Chromium-Containing Wastes (pages 72-96)	<input type="button" value="Add to Cart"/>
Satarupa Dey (Shyampur Siddheswari Mahavidyalaya, India)	<input type="button" value="Preview Chapter"/>
Chapter 6	\$29.50
Bacterial Remediation of Chromium From Industrial Sludge (pages 97-125)	<input type="button" value="Add to Cart"/>
Dipankar Roy (Calcutta University, India & St. Xavier's College, India), Arup Kumar Mitra (St. Xavier's College, India)	<input type="button" value="Preview Chapter"/>
Chapter 7	\$29.50
Phytoremediation: A Modern Approach (pages 126-146)	<input type="button" value="Add to Cart"/>
Suparna Pal (Lady Brabourne College, Kolkata, India)	<input type="button" value="Preview Chapter"/>
Chapter 8	\$29.50
Ricinus communis: A Potent Lead (Pb) Accumulator (pages 147-164)	<input type="button" value="Add to Cart"/>
Raikamal Pal (Shri Shikshayatan College, India)	<input type="button" value="Preview Chapter"/>
Chapter 9	\$29.50
Environmental Fluoride: Impact on Humans, Animals and Its Remediation Strategies (pages 165-188)	<input type="button" value="Add to Cart"/>
Junaid Ahmad Malik (Government Degree College, Bijbehara, India)	<input type="button" value="Preview Chapter"/>
Chapter 10	\$29.50
Cadmium- and Lead-Tolerant PGPRs as Proficient Toxicity Alleviators for Agricultural Crops (pages 189-204)	<input type="button" value="Add to Cart"/>
Amit Kumar Pal (Department of Botany, University of Kalyani, India), Anjan Hazra (Agricultural and Ecological Research Unit, Indian Statistical Institute, Kolkata, India), Chandan Sengupta (Department of Botany, University of Kalyani, India)	<input type="button" value="Preview Chapter"/>
Chapter 11	\$29.50
Fungi-Mediated Detoxification of Heavy Metals (pages 205-219)	<input type="button" value="Add to Cart"/>
Suchhanda Ghosh (Shri Shikshayatan College, India)	<input type="button" value="Preview Chapter"/>
Chapter 12	\$29.50
An Eco-Friendly Approach for the Eradication of Heavy Metal Contaminants by Nano-Bioremediation (pages 220-236)	<input type="button" value="Add to Cart"/>
Chandana Mohanty (Kalinga Institute of Industrial Technology (Deemed), India), Sneha Shripama Satpathy (Kalinga Institute of Industrial Technology (Deemed), India), Sweta Mohanty (Kalinga Institute of Industrial Technology (Deemed), India)	<input type="button" value="Preview Chapter"/>
Chapter 13	\$29.50
Sustainable Treatment of Landfill Leachate Using Constructed Wetlands: An Eco-Friendly Approach (pages 237-255)	<input type="button" value="Add to Cart"/>
Vivek Rana (Central Pollution Control Board, Ministry of Environment, Forest, and Climate Change, Government of India, Delhi, India)	<input type="button" value="Preview Chapter"/>
Chapter 14	\$29.50
Safety and Efficacy of Pseudomonas Exopolymer in Sequestration of Iron From Aqueous Environments (pages 256-272)	<input type="button" value="Add to Cart"/>
Moushumi Ghosh (Thapar Institute of Engineering and Technology, India), Divya Sharma (Thapar Institute of Engineering and Technology, India), Taranpreet Kaur (Thapar Institute of Engineering and Technology, India)	<input type="button" value="Preview Chapter"/>
Chapter 15	\$29.50
Recent Advancements in Bioremediation of Metal Contaminants (pages 273-287)	<input type="button" value="Add to Cart"/>
